Working Prototype Known Problems Report

Product name: Pseudo
Team name: Pseudonauts
Date: 12/8/2020

List of functions not working correctly: List all problems with software that has been identified. Include in the item entry the input/action that causes failure; location of fault (if known); possible action for removal of fault.

- Unidentified memory leak after long term operation without running debugging(might cause gui crash)
- Some error messages do not display the correct line numbers or they have inconsistent line numbers.
- The "Get" keyword cannot get nested list or tables:
    - Example Pseudo code to replicate error:
    ```
    set d to {"1": {1: 2, 3: 4}, "2": 2}
    set result to 0
    set result2 to 0
    get "1" from d and store into result
    display result
    get 1 from result and store into result2
    display result2
    ```
  Solution:

  You need to have both `result` and `result2` to be initialized to table data types. So:
    ```
    set result to {}
    set result2 to {}
    ```
- In the Help->Help menu option, the "Compare" and "Append" keyword examples are the same, they should be different.
    - Solution would have to be changing the help_manual global in "compare.py" to show examples of using "Compare".
